```
escape_velocity (generic function with 1 method)
```

1 The Hulse-Taylor Pulsar

Hulse and Taylor were awarded the Nobel Prize in Physics in 1993 for their analysis of the binary neutron star PSR B1913+16, in which they showed that its orbit was gradually shrinking as a result of gravitational wave emission, a key prediction of Einstein's theory of General Relativity. Let us take $\mu = M_1 M_2 / (M_1 + M_2)$ is the reduced mass and $M = M_1 + M_2$ is the total mass. You may assume that both masses are the same, $M_1 = M_2 = 1.4 M_\odot$, and remain constant as the orbit evolves. The total angular momentum of the system, assuming circular orbits, is $L = \mu \sqrt{G M a}$, where a is the separation of the stars. General relativity predicts that the orbit will lose angular momentum due to gravitational waves at a rate: $dL/dt = -$, (5) (You don't need to derive this!) (a) Because the masses are constant, gravitational waves cause the orbital radius to decrease. By taking the derivative of $L(t)$ for a binary in a circular orbit, show that $dL/dt = \sqrt{G M_1^3 / 2} da/dt$.

```
function t_merge(M, a0)
    5 * (c^5 * a0^4) / (512 * G^3 * M^3) |> u"yr"
end

"""binary's orbital period Pb"""
function P_b(M, a0)
    sqrt(4 * pi^2 * a0^3 / G / M) |> u"yr"
end

@show t_merge(1.4u"Msun", 1e7u"m")

a0 = 3e9u"m"

@show P_b(2.8u"Msun", a0) |> u"hr"
```

```
t_merge(1.4 * u"Msun", 1.0e7 * u"m") = 1.1683704968163275 yr
P_b(2.8 * u"Msun", a0) |> u"hr" = 14.87731015234723 hr
```

```
14.87731015234723 hr
```

```
function dPbdt(M, Pb)
  -192 * pi / 2^(1 / 3) / 5 * (G * M / c^3)^(5 / 3) * (2 * pi / Pb)^(5 / 3) |
> upreferred
end

let M = 1.4u"Msun", Pb = 8u"hr"
@show dPbdt(M, Pb)
end
```

```
dPbdt(M, Pb) = -1.8912371970169034e-13 s-14503599627370496
```

```
-1.8912371970169034e-13 s-14503599627370496
```

2 Gamma-Ray Bursts

The traditional classification of gamma-ray bursts (GRBs) into short and long categories has been challenged by recent observations. Notably, GRB 230307A, a long-duration burst lasting approximately 200 seconds, was linked to the merger of two neutron stars—a phenomenon typically associated with short GRBs. This event, observed by NASA’s James Webb Space Telescope, also marked the first detection of the heavy element tellurium from such a merger, highlighting the role of these cosmic events in synthesizing heavy elements.
